 Review Proposals FAPs

Welcome to the STFC online Facility Access Panel (FAP) proposal review system

This page is for FAP reviewers and Chairs to scientifically review any assigned proposals.

If you are trying to submit a proposal, please change your role from "FAP Reviewer" / "FAP Chair" to "User" by clicking the head icon in the top right-hand corner of this page.

For guidance on how to review proposals please see [here](#).

If you have any queries on your assigned proposals, please contact your FAP Secretary.

If you have any technical issues using the online system, please email fase-support@stfc.ac.uk

This system will automatically log out after 30 minutes of inactivity, and any unsaved changes will be lost.

For persistent system issues, please contact fase-support@stfc.ac.uk

On the **Review Proposals** page, you can see all the proposals submitted to the FAP, not just the ones you've been assigned to review.

On the **FAPs** page, you will be able to see the Facility Access Panels you belong to, together with FAP specific documentation, such as the FAP booklet.

Experiment

From the **PROPOSAL INFORMATION** tab, you can view the Proposal’s details.

Proposal ID	26110003
Title	Laser Driven Ion Acceleration for Compact Medical Proton Sources
Abstract	This experiment aims to exploit these capabilities to produce and characterise high energy proton beams from thin solid targets irradiated at intensities exceeding 10 10 W/cm , leveraging Astra Gemini s 30 fs, 15 J pulses and advanced diagnostics developed through past CLF campaigns . The primary objective is to map energy spectra, divergence, and stability of laser accelerated proton beams across a range of target materials and thicknesses, supported by multi angle ion spectrometry, time of flight detectors, and ultrafast optical probing. A secondary objective is to evaluate the feasibility of compact beam transport concepts relevant to applications such as medical proton therapy. By integrating knowledge from previous CLF experiments in particle acceleration, ultrafast plasma dynamics, and high contrast laser target interaction, this project aims to deliver new insights into optimising proton yield and beam quality. The outcomes will advance understanding of ion acceleration physics while supporting future development of compact, laser driven accelerator technologies.
Principal Investigator	Liam O'Connor (liamoconnor@utoronto.ca) (University of Toronto) (CANADA)
Co-Proposers	Thabo Mbeki (thabo.mbeki@manchester.ac.uk) (University of Manchester) (UNITED KINGDOM) Ana Silva (ana.silva@manchester.ac.uk) (University of Manchester)
Please give a brief summary of the proposal objectives	1. Generate high energy proton beams using ultra short, high intensity laser pulses interacting with thin solid targets. 2. Characterize proton energy spectra using standard diagnostics such as RCF stacks and Thomson parabola spectrometers. 3. Investigate scaling laws for proton acceleration across different target materials and thicknesses. 4. Assess suitability for compact accelerator injection, including beam divergence, reproducibility, and flux stability.
Who have you contacted at the CLF to discuss your requirements?	Jobe Stevens

Facility & Funding

Facility / Area	Gemini TA3
Number of weeks requested	1
Do you have any dates when you would be unavailable to carry out your experiment?	No
The proposal falls under the following science programmes	Engineering
Does this proposal have any industrial involvement/sponsorship?	No
Does your group have wider industry links not directly involving your present use of the Central Laser Facility?	No
Do you have any research grants associated with this proposal?	No

TECHNICAL REVIEWS tab

✕ Proposal: Laser Driven Ion Acceleration for Compact Medical Proton Sources (26110003)

PROPOSAL INFORMATION TECHNICAL REVIEWS GRADE

New technical review

Technical Review ID	5263 (Pre-submission)
Status	FEASIBLE
Time allocation(undefineds)	1
Public Comment	Scientific quality and impact: The proposal addresses an active and relevant area of high-power laser science: laser-driven proton acceleration. The scientific goals are well defined, and the experiment is positioned to provide meaningful data on proton beam energy, divergence, and stability. The link to potential applications (e.g. compact accelerators) is appropriate without overstating near-term outcomes. Fit to facility: The experiment is well matched to CLF's flagship high-power laser systems. It demonstrates understanding of what the facility can realistically deliver and does not rely on speculative or unproven capabilities. The proposal makes effective use of CLF diagnostics and target areas. Deliverability and risk: The technical risk is moderate to low. The core experiment is viable without requiring major new developments or facility modifications, and optional enhancements are clearly separated from baseline objectives. The pre-set-up and safety considerations appear manageable within standard CLF processes. User preparedness: The team demonstrates familiarity with high-power laser experiments and appropriate planning for data acquisition, shot rate, and target usage. The proposal shows evidence of learning from prior work and has credible mitigation strategies for expected challenges such as shot-to-shot variability. Value for beamtime: The proposed work offers good scientific return for the requested beamtime, with the likelihood of producing publishable results and informing future experimental campaigns. The experiment also has potential to benefit the wider CLF user community through transferable methods and diagnostics.

Proposal grading and prioritisation

The CLF FAPs will peer review all submitted proposals and agree an overall grade for each proposal. The grades are an indication of the associated definitions and expected outcomes are given in the table on the next page.

Proposals which would have been ranked 1 to 7, except for an identified and correctable element, should be marked R for resubmission.

Grading Guide

Application scoring matrix

Score Range	Definition	Guidance
6.0 – 7.0	Exceptional Work that is at the leading edge internationally, addresses all of the assessment criteria, and meets the majority of them to an exceptional level. Likely to have a significant impact on the field	Fundable
5.0 – 5.9	Excellent	Fundable

Grading Guide

Score Range	Definition	Guidance
6.0 – 7.0	Exceptional Work that is at the leading edge internationally, addresses all of the assessment criteria, and meets the majority of them to an exceptional level. Likely to have a significant impact on the field	Fundable
5.0 – 5.9	Excellent Work that is of a high international standard, and addresses and meets the majority of the assessment criteria to a very high level. Will answer important questions in the field.	Fundable
4.0 – 4.9	Very Good Work that is internationally competitive and meets the majority of the assessment criteria to a high level. Will advance the field.	Fundable
3.0 – 3.9	Good Work that has merit and/or meets some of the assessment criteria to an adequate level. Likely to advance the field.	Fundable in principle but unlikely to be funded
2.0 – 2.9	Not Competitive Work that is potentially of some merit and meets some of the assessment criteria to an adequate level, but which is not internationally competitive. Unlikely to advance the field significantly.	Not Fundable
1.0 – 1.9	Un-fundable Work that is of no significant scientific merit, flawed, or duplicative of other research, or for which the applicants do not present evidence of a satisfactory track record, and which does not meet the majority of the assessment criteria to an adequate level. Unlikely to advance the field.	Not Fundable
R	Resubmit Proposals which would have been ranked 1 to 7, except for an identified and correctable element, should be marked R for resubmission.	Resubmit

I

Value for Beamtime

The proposed experiment offers an excellent return on investment. The physics is clear and achievable, the diagnostics are appropriate and likely to yield interpretable data, and the potential for broader impact is high. The results will inform future experiments, support ongoing development of laser-driven accelerators, and contribute to CLF's reputation in high-energy-density and particle-acceleration science.

I **recommend approval** of the requested beamtime.
The proposal is scientifically compelling, technically sound, and strategically relevant to the CLF mission at the facility. This is a strong candidate for support and should be prioritised accordingly.

Overall Evaluation: This is a strong, well-constructed proposal that is well aligned with the strategic scientific goals of the Central Laser Facility. The experiment presents a clear and compelling case for investigating laser-driven proton acceleration using high-power, ultra-short-pulse lasers, and the team demonstrates an excellent understanding of both the underlying physics and the operational realities of CLF experiments. The proposal is scientifically timely, technically feasible, and likely to deliver high-impact results. Scientific Merit and Impact The scientific objectives—mapping proton energy spectra, divergence, and beam stability across a range of target conditions—address an important and active area of high-intensity laser–plasma research. The potential link to compact proton sources for medical applications is appropriate and adds value without overselling immediate clinical translation. The proposed measurements will contribute both to fundamental understanding of sheath-driven ion acceleration and to applied accelerator development, placing the work at the intersection of high-power laser physics and emerging technology research. This experiment builds on a substantial legacy of particle-acceleration studies at CLF, and the proposed methodology is informed by previous successful campaigns. The expected outcomes, including improved scaling-law data and refined proton-beam characterisation, will be relevant across the broader high-intensity laser community. Technical Feasibility The experimental configuration—using thin-foil targets, standard ion diagnostics (Thomson parabola, TOF, RCF), and optional ultrafast optical probing—is well matched to Vulcan and Astra Gemini capabilities.

Comment

The requested laser parameters fall firmly within established operational regimes, and no critical long-lead developments are required for the baseline experiment. Any specialist equipment is clearly identified and appropriately assigned as user-supplied. The proposal shows realistic planning regarding target shot-count, alignment procedures, and diagnostic integration. The pre-set-up and engineering requirements appear manageable, and no significant safety or infrastructure concerns are evident. Team Preparedness and Experimental Planning The team demonstrates a solid understanding of experimental constraints, data-acquisition workflows, and potential sources of variability. They provide a clear plan for both baseline measurements and optional scientific extensions, ensuring that the essential physics goals can be achieved even if experimental conditions evolve during the campaign. The integration of insights from previous CLF experiments strengthens confidence in their preparation and likelihood of success. Value for Beamtime The proposed experiment offers an excellent return on investment. The physics is clear and achievable, the diagnostics are appropriate and likely to yield interpretable data, and the potential for broader impact is high. The results will inform future experiments, support ongoing development of laser-driven accelerators, and contribute to CLF's reputation in high-energy-density and particle-acceleration science. I recommend approval of the requested beamtime. The proposal is scientifically compelling, technically sound, and strategically relevant to the CLF mission. It poses manageable risk, offers high potential impact, and is well suited to the capabilities of the facility. This is a strong candidate for support and should be prioritised accordingly.

The Central Laser Facility (CLF) at the Rutherford Appleton Laboratory is one of the world's leading laser facilities providing scientists from the UK and Europe with an unparalleled range of state of the art technology to carry out a broad range of experiments in physics, chemistry and biology. Our laser facilities range from advanced, compact tuneable lasers which can pinpoint individual particles to high power laser installations that recreate the conditions inside stars.
