Proposal grading and prioritisation

The ISIS FAPs will peer review all submitted proposals and agree an overall grade for each proposal. The grades and an indication of the associated definitions and expected outcomes are given in the table below.

Proposals which are scientifically or technically flawed should be rejected and marked X. Proposals which would have been ranked 1 to 10, *except for an identified and correctable element*, should be marked R for resubmission; panels may wish to recommend use of the ISIS Rapid or Xpress access routes in such cases.

PROPOSAL INFORMATION

New proposal

Proposal ID	
Title	Evaluating Radiation-Induced Failure Modes in 3D-Stacked Memory Architectures under ChipIR Neutron Flux
Abstract	Three-dimensional (3D) stacked memory technologies—such as High Bandwidth Memory (HBM) and Hybrid Memory Cube (HMC)—are increasingly deployed in high-performance computing, aerospace, and AI accelerator systems due to their superior density and bandwidth. However, their vertically integrated architecture introduces new vulnerabilities to radiation-induced failure mechanisms, particularly under atmospheric neutron exposure. This experiment aims to systematically characterise neutron-induced failure modes in 3D-stacked memory devices using the ChipIR beamline at ISIS, which provides an atmospheric-like neutron spectrum. The study will quantify single-event effects (SEEs), including single-event upsets (SEUs), multi-bit upsets (MBUs), and potential destructive events, with a focus on how vertical integration, through-silicon vias (TSVs), and reduced node geometries influence susceptibility. The results will inform models of reliability in mission-critical systems, including avionics, autonomous systems, and data centres, and support the development of mitigation strategies such as error correction, redundancy, and shielding.
Principle Investigator	Sophie Müller (sophie.müller@northumbria.ac.uk) Northumbria University , United Kingdom
Co-Proposers	James Smith (j.smith07@cam.ac.uk) Cambridge University , United Kingdom Ana Silva (ana.silva@northumbria.ac.uk) Northumbria University , United Kingdom Thomas Dubois (Thomas.dubois@northumbria.ac.uk) Northumbria University , United Kingdom
Is the PI a student?	No

Research Support

Research Grants	
Does this proposal have any industrial involvement/sponsorship?	No
Please give us the details of this involvement	
Are there any PhD students on this proposal?	No
Please detail any other support your proposal will receive	

Is the PI based at a Brazilian, Malaysian or Indonesian institution?	No
--	----

Publications

Publications

Experiment

The proposed access route is	ISIS Direct
Has this or a similar proposal been submitted to another facility recently?	No
How many days do you require?	4
Select instrument	ChiplR
What scientific technique are you using?	Electronics irradiation
Type of irradiation you are planning to use?	Neutrons
Please select the following neutron option that applies	Chiplr & NILE
The proposal falls under the following science programmes	Materials, Technique development, Physics
Have you discussed this proposal with a relevant ISIS beamline scientist?	Yes
Who is the ISIS beamline scientist?	Graham Durrant
Does your proposed experiment align with the UN Sustainable Development Goals for CO2 emissions or the UK Government ten point plan?	No
Temperature range	280 – 300 K
Pressure range	0.1 – 0.1 MPa
Magnetic field strength	0 – 0 T
Other sample environment variables if relevant	N/A - just standard atmospheric temperature and pressure

Samples

Samples	Commercial 3D-stacked memory devices: • HBM2 / HBM3 modules (if available) • Wide I/O 2 memory stacks • Hybrid Memory Cube (HMC)
---------	--

Hazards

Are there any radioactive hazards associated with any of your samples? If yes, please let us know which sample(s) and give more details	No
---	----

Do any of your samples contain nuclear materials? If yes, please let us know which sample(s) and give more details.	No
---	----

Are there any biological hazards associated with any of your samples? If yes, please let us know which sample(s) and give more details.	No
---	----

Are any of your samples sensitive to air? If yes, please let us know which sample(s) and give more details	No
--	----

Are any of your samples sensitive to water? If yes, please let us know which sample(s) and give more details	No
--	----

Other Facilities

Would you like to use the ISIS Deuteration Facility?.	No
---	----

Is this a joint proposal with Diamond Light Source?	No
---	----

Please tell us about any other facilities that relate to your proposal	
--	--

Science Case Upload

Upload document	science.case.pdf
-----------------	----------------------------------

I confirm the above	Yes

Technical Review

1 New technical review

Review

New technical review

Technical Review ID	7826
Status	FEASIBLE
Time Allocation (Days)	4
Public Comment	This is a well-justified, feasible, and impactful proposal that leverages ChipIR's capabilities effectively. It addresses a growing need in modern electronics reliability and is likely to produce publishable and practically useful results.
Internal Comment	This proposal addresses a clear and timely gap in radiation effects research. As 3D-stacked memory becomes critical in high-performance and safety-critical systems, understanding neutron-induced failure modes is essential. The focus on: Multi-bit upsets, Vertical integration effects and TSV-related phenomena is particularly valuable, as these are not well characterised in the literature.

This proposal presents a well-motivated study addressing the radiation tolerance of emerging 3D-stacked memory technologies under atmospheric neutron exposure. The topic is timely, given the increasing deployment of such devices in high-performance and safety-critical systems. The use of ChipIR is appropriate, and the experimental approach is largely conventional and technically sound.

However, while the scientific case is strong, there are some concerns regarding the level of insight achievable with commercial devices and the extent to which the results will advance understanding beyond established SEE characterisation approaches.

Final Recommendation

This is a solid, well-justified proposal that fits well within the scope of ChipIR and is likely to produce useful data. While there are some limitations in the depth of insight achievable with the proposed approach, the experiment remains worthwhile and feasible.

Public Comment

This is a well-justified, feasible, and impactful proposal that leverages ChipIR's capabilities effectively. It addresses a growing need in modern electronics reliability and is likely to produce publishable and practically useful results.

Internal Comment

This proposal addresses a clear and timely gap in radiation effects research. As 3D-stacked memory becomes critical in high-performance and safety-critical systems, understanding neutron-induced failure modes is essential.
The focus on: Multi-bit upsets, Vertical integration effects and TSV-related phenomena is particularly valuable, as these are not well characterised in the literature.
